

Data Flow Diagram & User Stories

Data Flow Diagram (textual)

[Agent] --(sets Impact)--> [Incident Form]

[Agent] --(changes Impact)--> [onChange Client Script] --> [Urgency field auto-set + info msg]

[Agent] --(clicks Submit)--> [onSubmit Client Script] --(checks Assigned To)--> [Block save + error] OR [Incident record saved to incident table]

[Agent] --(edits State in list)--> [onCellEdit Client Script] --> [Alert] --> [Edit rejected]

[Agent] --(edits State on form)--> [Standard save] --> [Incident record updated]

User Stories

ID	User Story
US-01	As a service desk agent , I want the Assignment group field to become mandatory when Impact is High, so that high-impact incidents are always routed to a team.
US-02	As a service desk agent , I want Urgency to auto-fill when I set Impact to High, so that I don't have to manually match the two fields.
US-03	As an incident manager , I want Urgency to be locked once Impact is High, so agents can't set an inconsistent urgency value.
US-04	As a service desk agent , I want to be blocked from saving a high-impact incident without an assigned owner, so nothing falls through the cracks.
US-05	As an ITSM administrator , I want direct State edits from the incident list to be blocked, so that state transitions always go through the governed form process.

US- As an **ITSM administrator**, I want all of the above behavior to automatically
06 reverse when Impact is no longer High, so lower-impact incidents aren't
over-constrained.
