

Proposed Solution

Enforce data integrity entirely on the client side using a combination of one **UI Policy** (declarative, condition-based field control) and three **Client Scripts** (custom logic UI Policy can't express):

- A UI Policy, **High Impact Control**, triggers when **Impact = High** and drives two actions: making **Assignment group** mandatory and **Urgency** read-only — both of which automatically reverse when Impact is no longer High.
- An **onChange** Client Script auto-sets Urgency to High the moment Impact is changed to High, with an informational message, so agents aren't left to do it manually.
- An **onSubmit** Client Script blocks saving a High Impact incident that has no Assigned To, with a clear inline error.
- An **onCellEdit** Client Script blocks direct State edits from the Incident list view, forcing state changes through the governed form.
